Main areas of research

My research activities span different field starting in the 90's from Human genetics to the application of advanced genomics methodologies to non model organisms. In the last 15 years my main research topics are in fact focused on genomics and molecular immunology of the mollusc bivalve *M. galloprovincialis*. This intense research activities is reported by the publication of about 100 peer-reviewed papers. I would like to mention here the environmental genetic studies on *M. galloprovincialis*. Since the very first years of the XXI century I have developed a collection of cDNA clones for the analysis of gene expression in the Mediterranean mussel. The use of bivalve mollusc in the monitoring of chemical contamination of coastal environments has, for decades, used in both the US and in many European countries in international programs of Mussel Watch. Integrating my biotechnology skills I have developed a protocol for genetic analysis to highlight the biotic and abiotic contamination in the mussel. Deeply analyzing the mussel genome I have contributed to depict the immunology of this animal and I have discovered a numbers of peptides with biotechnological interest. In the frame of several collaborations with colleagues of different organization (Universities and Research centers) I have implemented the most advanced genomic tools in the most different scientific area such as botany, animal husbandry and environmental biology. Just as example, I can mention here the development of genomics on crayfish and metagenomics analysis in marine environment.
